Vascular access/vascular surgery

- Vascular surgery is more involved in vascular access than urologists.
- Vascular surgery is involved in renal transplantation
 - ✓ *Management of patients in renal insufficiency is more and more realized by teams practising both vascular access and grafting*
- Vascular access surgery has taken benefit from the improvements of vascular surgery

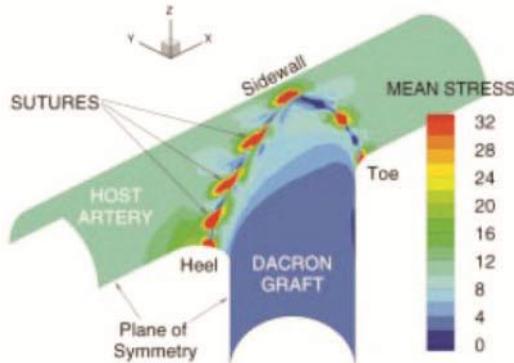

Areas of improvement of vascular access

- materials
- Imaging methods
- Endovascular
- Management of arterial complications after VA

Vein IMAGING

Guideline 2.1. Clinical evaluation and non-invasive ultrasonography of upper extremity arteries and veins should be performed before vascular access creation (Evidence level II).

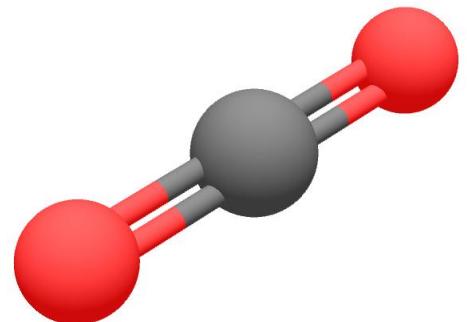

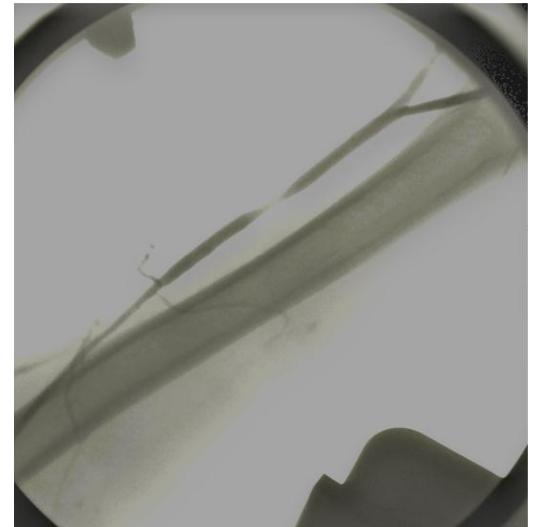

Guideline 2.2. Central vein imaging is indicated in patients with a history of previous central vein catheters (Evidence level IV).

Table 3. Treatment Success and Patency End Points in the Intention-to-Treat Population, According to Treatment Group.*

End Point	Stent Graft no. of patients/total no. (%)	Balloon Angioplasty no. of patients/total no. (%)	P Value
Anatomical success	91/97 (94)	68/93 (73)	<0.001
Hemodynamic success	97/97 (100)	93/93 (100)	
Clinical success	85/97 (88)	78/93 (84)	0.49
Procedural success	91/97 (94)	68/93 (73)	<0.001
Primary patency of treatment area			
2 mo	77/96 (80)	71/92 (77)	0.72
6 mo	46/91 (51)	20/86 (23)	<0.001
Primary patency of access circuit			
2 mo	76/96 (79)	71/92 (77)	0.86
6 mo	35/92 (38)	17/86 (20)	0.008

* Definitions of treatment success are listed in the Supplementary Appendix.

Table 4. Adverse Events at 6 Months, According to Treatment Group.*

Adverse Event	Stent Graft no. of patients/total no. (%)	Balloon Angioplasty no. of patients/total no. (%)	P Value
Infection	6/95 (6)	2/90 (2)	0.28
Thrombotic occlusion	31/95 (33)	19/90 (21)	0.10
Restenosis	38/95 (40)	69/90 (77)	<0.001

Aneurysmal degeneration of the donor artery after vascular access

Jean Marzelle, MD,^a Valbon Gashi, MD,^b Hong-Duyen Nguyen, MD,^c Albert Mouton, MD,^d Jean-Pierre Becquemin, MD,^a and Pierre Bourquelot, MD,^e *Créteil, Tourcoing, Olivet, and Paris, France; and Pristina, Kosovo*

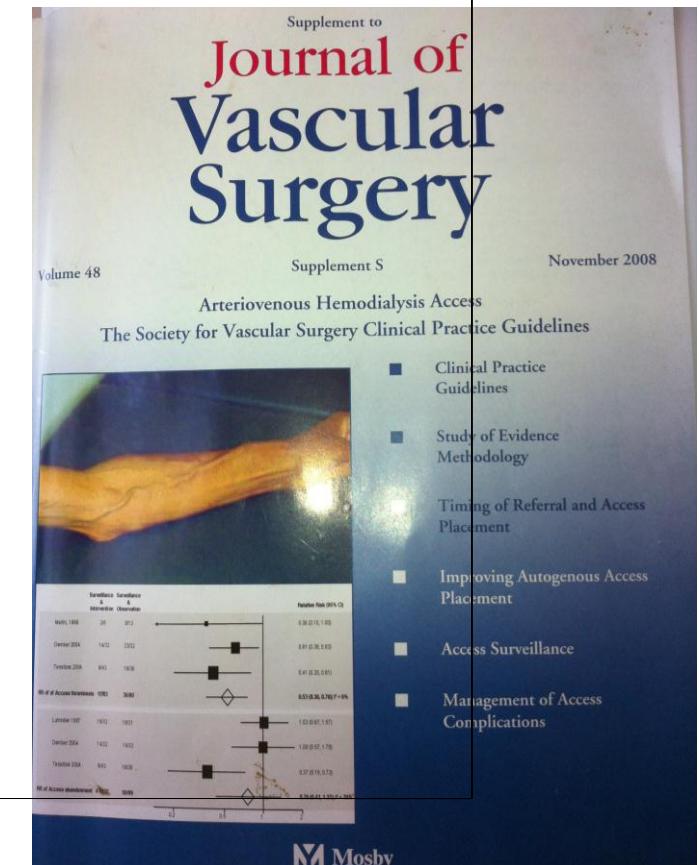

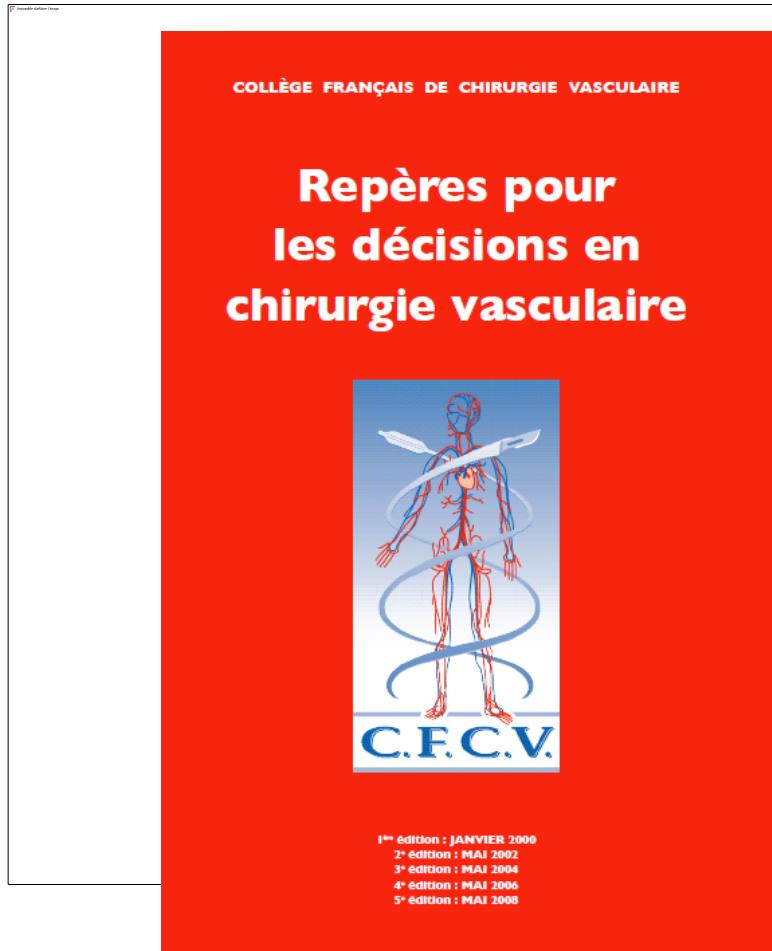

Objective: This retrospective study analyzed the characteristics, potential risks, and therapeutic options of true aneurysms of the donor artery in arteriovenous fistulas (AVFs) for dialysis access.

Methods: We retrospectively collected data of patients with aneurysmal degeneration (AD) after AVF creation from surgeons who were members of the French Society for Vascular Access, treated from January 2006 to May 2011. The study excluded patients with pseudoaneurysms. Patient demographics, type of access, aneurysm characteristics, symptoms, treatment, and follow-up were recorded.

Results: Seven men and three women (mean age, 38.1 ± 5.3 years) were identified with AD (mean diameter, 44.5; range, 24–80 mm). Mean duration of access was 83.6 ± 48.8 months. Diagnosis of AD was at 117.5 ± 53.8 months after access creation. The initial access was radiocephalic, six; ulnobarbaric, one; brachiocephalic, two; and brachiobasilic, one. Three patients had two successive accesses: one brachioaxillary polytetrafluoroethylene (PTFE) graft and two proximalizations of a failed radiocephalic AVF. Symptoms were pain and swelling, four; pain related to total thrombosis without signs of ischemia, two; median nerve compression, two; pain related to contained rupture, one; and subacute ischemia due to embolic occlusion of both radial and interosseous arteries, one. AD location was brachial, seven; axillary, one; radial, one; and ulnar, one. Eight patients underwent surgical aneurysm excision associated with interposition bypass using great saphenous vein, two; basilic vein, one; PTFE, three; Dacron, one; and allograft, one. Two patients needed secondary PTFE bypass because of progression of AD to the inflow artery and dilatation of the venous bypass. With a mean follow-up of 20.3 ± 17 months, all bypasses but one remained patent.

Conclusions: AD is a rare but significant complication of vascular access. Surgical correction should be discussed in most cases due to potential complications. After resection, the choice of reconstructive conduit is not straightforward. (*J Vasc Surg* 2012;55:1052–7.)

Standards

Accès vasculaires pour Hémodialyse
Dr Benoit BOURA, Dr Myriam COMBES

Cursus organisation: theoretical sessions

2 Février 2013, Amphi ND Bon Secours (Hôpital St Joseph)

SESSION THEORIQUE OBLIGATOIRE: INFECTIONS 8H45 - 12H30

Conduite à tenir devant un anévrisme infectieux de l'aorte *M Kitzis*

Conduite à tenir devant une infection de prothèse aortique/aortoiliaque *L Chiche*

Conduite à tenir devant un pontage infecté infra-inguinal *Fh Tresson*

Indications des stents et endoprothèses aortiques *Y Touma*

SESSION THEORIQUE OBLIGATOIRE: ABORDS VASCULAIRES 14 H - 17 H

Conduite à tenir devant une zone de nécrose *Q Pellenc*

Conduite à tenir devant une anomalie à l'écho-doppler de contrôle *G Franco*

Conduite à tenir devant une occlusion de fistule *R De Blic*

Abords vasculaires chez l'enfant *P Bourquelot*

Cursus organization: practice

Criteria of vascular unit qualification

Article 4 du règlement intérieur du CFCV

Seuils d'activité du service

Le SV doit faire état d'un minimum annuel de 500 admissions en chirurgie vasculaire avec prise en charge des urgences.

N o	Seuils annuels	N
1	Admissions en chirurgie vasculaire	500
3	Reconstructions artérielles ou veineuses centrales, ouvertes, endovasculaires ou coelioscopiques	250
4	Chirurgies veineuses superficielles Si 3 n'est pas suffisant	300
5	Accès d'hémodialyse si 3 n'est pas suffisant	200

conclusion

- The aim of the french college of vascular surgery is to promote the teaching of vascular access to the young vascular student
- To promote research in vascular access
- Cf IDEAL RECOMMENDATIONS

No surgical innovation without evaluation: the IDEAL recommendations

- Use of new technologies and procedures in patients are reported, whether successful or not, the **I**nnovation phase
- Endovascular repair for ruptured aneurysm further **D**eveloped in a few specialist centres
- For reporting of the 1st hundred cases, the **E**xploratory phase, both prospective databases and randomised trials to assess feasibility can be very valuable
- Design of initial studies is crucial to obtaining accurate information, to plan the **A**sessment stage
- Followed by **L**ong-term monitoring to report on any delayed adverse events
